

1. What corrections did you have to make?

I had to correct the “Add a comment...” <input> tag in my card footer to include an aria-label attribute. Additionally, I had to add an aria-label attribute to every tag in my components. Lastly, I used the WAVE Contrast tool to adjust the colors of all my text to ensure there were no contrast errors.

2. Given that the photos and captions rely on user-generated content, do you think that the accessibility problems are all solvable? Why or why not?

Since photos are user-generated content, I think that not all accessibility problems are solvable. While foreground and background color for text components can be controlled by the developer, user-generated image content cannot be controlled. Therefore, it would be unrealistic to assume that all accessibility problems are easily solvable through static means.

3. Do you think your website is usable if you turn off the CSS? Why or why not?

Yes, my website will technically still be usable as all the functionality, such as displaying images and interacting with content, will still work. However, without CSS styling, navigating the website and identifying certain components will be very difficult for users. Additionally, some functionality such as hover effects will not work.

4. Do you think your website is usable if you turn off the images? Why or why not?

Yes, the website will still be usable without images as they will simply be replaced by their alt-text. However, since the purpose of the website is to serve as a photo-sharing app, turning off images defeats the entire purpose of the website.

5. Submit a screenshot of your Wave report

Screenshot of Wave Report titled *WaveReport-HugoZhang.png*.
